

"Hjorth's" Pliers

Wiebusch & Hilger, Ltd., 9 to 15 Murray street, New York, as sole agents for Wm. Hjorth & Co., Jamestown, N. Y., are offering "Hjorth's" Pliers, two patterns of which are illustrated. Both are made from high grade steel drop forgings. The Bent Nose Plier is the latest addition to the line. In operation

"HJORTH'S" BENT NOSE SLIP-JOINT PLIER.

this tool is handled in the same manner as the regular style of slip-joint pliers. The jaw, however, is bent at an angle of 45 degrees, making it exceptionally handy for plumbers, electricians and automobilists. The makers remark that the construction of the jaw enables it to be used in corners and close quarters

"HJORTH'S" SLIP-JOINT PLIER, 6-INCH SIZE.

where it would be difficult to make use of the Plier with the straight nose. This Plier is made only in 10-inch size and is finished both full nickel-plated and also natural or self-colored. The factory makes the usual styles of straight nose slip-joint Pliers, shown herewith. A feature of all these Pliers is that the jaws

and screw driver ends are carefully hardened and tempered, and they also use a tempered connecting bolt. The advantage of this bolt being tempered will readily be apparent to any user who has had pliers of this pattern made with a soft bolt. Such Pliers are made in 6, 8 and 10-inch sizes, both in full nickel-plated and also black or self-colored.

"Lightning" Wrench

Wiebusch & Hilger, Ltd., 9 Murray street, New York, as sole agents for Wm. Hjorth & Co., Jamestown, N. Y., are offering the trade the "Lightning" Wrench, illustrated. It is made in 6 and 7 inch sizes, full nickel-plated, with solid jaw, and in 9 and 12-inch sizes, full polished and with a lower detachable jaw. Its

"LIGHTNING" WRENCH.

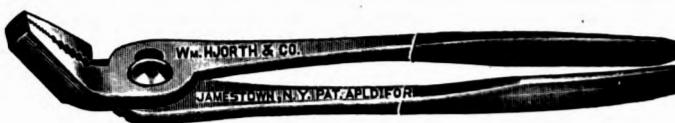

construction in this respect is clearly shown in the illustration. The advantage of this lower or wearing jaw being susceptible of removal, if broken or injured, is readily apparent. The construction of the Wrench is such that it will hold pipe rigidly and firmly without crushing and without the necessity of any

amount of pressure on the handles. It is claimed by the manufacturers that pipe can be seated firmly by the use of the upper handle alone.
